**Chuck capper** The Inline Secure Chuck Capper with Servo Feed-Screw offers high output with fewer parts to change and no adjustments. As the container moves

downstream, the servo feedscrew stabilizes the container and drives it through the pre-cap and torquing stations. With each function monitored by servo, every component moves within a fraction of a second, allowing for high-speed capping without torque errors. The equipment is ideal for all cap types from CR to metal caps and can manage even the most complicated cap shapes and diameters. The capper features less than 0.03-percent reject.
